

Montgomery® Safe-T-Tubes™

The **Montgomery® Safe-T-Tube™** is designed to maintain an adequate airway, as well as to provide support in the stenotic trachea that has been reconstituted or reconstructed. Our exclusive design of ridges and grooves along the extraluminal limb of the tube allows a ring washer to be attached, significantly reducing the possibility of accidental posterior displacement.

The Montgomery® Safe-T-Tube™ is available in five styles - Pediatric, Standard, Thoracic, Extra-Long and Tapered - in both clear and radiopaque models. Safe-T-Tubes™ are easy to insert, suction and remove, and can be used with anesthesia. Speaking valves to facilitate vocalization are also available. Shortened limbs can be ordered directly from our facility at no additional charge.

In addition, we offer the 8200 Series HMS System™, a complete laryngotracheal repair system with inner cannula.

Custom Lengths

Special situations require shortened Safe-T-Tube™ limbs. We offer a service to shorten any Safe-T-Tube™ to your exact dimensions and finish the ends with a smooth taper. Please call Customer Service for details.
